EASY

### 1. TreeHeight

Compute the height of a binary link-tree.

score: 100 of 100

#### Task description

In this problem we consider *binary trees*, represented by pointer data-structures. A pointer is called a *binary tree* if:

- it is an empty pointer (it is then called an *empty tree*); or
- it points to a structure (called a *node*) that contains a value and two pointers that are binary trees (called the *left subtree* and the *right subtree*).

A figure below shows a tree consisting of six nodes.

A *path* in a binary tree is a sequence of nodes one can traverse by following the pointers. More formally, a path is a sequence of nodes  $P[0], P[1], \dots, P[K]$ , such that node  $P[L]$  contains a pointer pointing to  $P[L + 1]$ , for  $0 \leq L < K$ .  $K$  is called the *length* of such a path.

The *height* of a binary tree is defined as the length of the longest possible path in the tree. In particular, a tree consisting only of just one

node has height 0 and the height of an empty tree is undefined. For example, consider the following tree:

Subtrees of nodes D, E and F are empty trees. Sequence A, B, E is a path of length 2. Sequence C, F is a path of length 1. Sequence E, B, D is not a valid path. The height of this tree is 2.

Assume that the following declarations are given:

```
class Tree(object):
    x = 0
    l = None
    r = None
```

Write a function:

```
def solution(T)
```

#### Solution

Programming language used: Python

Total time used: 5 minutes

Effective time used: 5 minutes

Notes: correct functionality and scalability

#### Task timeline

07:48:26

07:52:48

Code: 07:52:48 UTC, py, final, score: 100.00

```
1. def solution(T):
2.     if T is None:
3.         return -1
4.     return max(solution(T.l), solution(T.r)) + 1
```

#### Analysis

Detected time complexity:

**O(N)**

test	time	result
example example, size=6	0.050 s.	OK
simple full binary tree, size=3	0.050 s.	OK
simple_list	0.050 s.	OK

that, given a non-empty binary tree T consisting of N nodes, returns its height.  
For example, given tree T shown in the example above, the function should return 2.  
Assume that:

- N is an integer within the range [1..1,000].

Complexity:

- expected worst-case time complexity is O(N);
- expected worst-case space complexity is O(N).
